Polyurethane

From Wikipedia, the free encyclopedia.

Urethane is any chemical compound produced by the reaction of an isocyanate and an alcohol according to the following formula:

Although the reaction had been known for some decades, it was not until 1937 that Otto Bayer discovered how to make a useful plastic out of polyisocyanate and polyol.

Urethane technology was brought to America in 1953 by Jean-Pierre Abbat and Dr. Fritz Hartmann.

Polyurethane can be made in a variety of textures and hardnesses by varying the particular monomers used and adding other substances. It is used in adhesives, elastomers, foams, seals, gaskets, condoms, and hard parts.
